

Shoe leather

Natural footwear leather - is a material, which is used for producing different types of shoes:

- safety footwear is made of high-quality natural hydrophobic leather. This is leather with high water-resistant properties, which is tested under dynamic conditions and provides waterproofing of products from 1 to 6 hours. The main protection against water inside the skin, surface wetting is allowed, but no leaves traces after drying.
- classic shoes is made of high quality leather with a full grain and semi-aniline coating finish. Surface (top layer) is stamping very soft, its natural structure is preserved and small natural features such as scars or veins are visible on the surface. This variant will always have a unique natural pattern.
- sport footwear can be made of full grain leather, buffed grain leather, split leather, embossed leather, or combination several types of leather. Finished leather for sport footwear must be durable, with low thermal conductivity (for winter footwear), good water vapor permeability, protect from moisture, cooling, frostbite and mechanics. Each finished pair of shoes is unique in its own way, because the structure, pattern and finish of the leather are different, and its advantages there are reliability and resistance to wear.

BASIC REQUIREMENTS FOR NATURAL LEATHER FOR SHOES:

- softness and elasticity
- uniformity of color;
- tensile strength;
- moisture and air permeability;
- strength to bends

Our leather meets all international quality standards
